PG Diploma in AI-ML and Agentic AI Engineering · Cohort 2 · Build 1

BRIEF A · GROWTH

Which lever moved test volume in H1 2026 — patients, visits, or tests per visit — and what does that mean for the 60,357-line gap to plan?

Kalpa Health recorded 455,383 booking test lines in H1 2026, up from 433,611 in H1 2025 — growth of +21,772 lines, or +5.02% year on year. Sum of n_tests on validated bookings, full local H1 periods based on slot_at.

Data: Kalpa Health validated bookings · H1 2025 – H1 2026

Dr Menon's words, and our translation

Her words:
“Volume grew five percent. We planned for nineteen. Before anyone touches a target, tell me which lever moved — patients, visits, or tests per visit.”
Our translation:
A driver tree: T = P × (B/P) × (T/B). It splits growth into people (distinct person IDs), visits per person, and test lines per visit.
The decision it drives:
Which interventions are even candidates to recover the 60,357-line provisional gap to plan (actual = 88.30% of the H1 2026 target). Nothing is changed on targets, staffing or reagent plans until the KPI definition, denominator and city crosswalk are signed off by their owners.

The driver tree: T = P × (B/P) × (T/B), H1 2025 → H1 2026

P · Distinct person IDs: 94,275 → 97,827 (+3.77% change · +3.70% log)

B/P · Visits per person: 2.0027 → 1.9833 (-0.97% change · -0.97% log)

T/B · Test lines per visit: 2.2966 → 2.3471 (+2.20% change · +2.17% log)

= T · Test lines (sum of n_tests): 433,611 → 455,383 +21,772 lines +5.02%

Descriptive accounting metrics, not causal effects. The variables are proxies for patients, visits and tests. Measure: sum of n_tests on validated bookings, superseded rescheduled records removed, full local H1 periods based on slot_at. Booking test lines are not proof of performed tests.

One sentence Dr Menon can say to her board

Kalpa Health recorded 455,383 booking test lines in H1 2026, up from 433,611 in H1 2025 — growth of +21,772 lines, or +5.02% year on year.

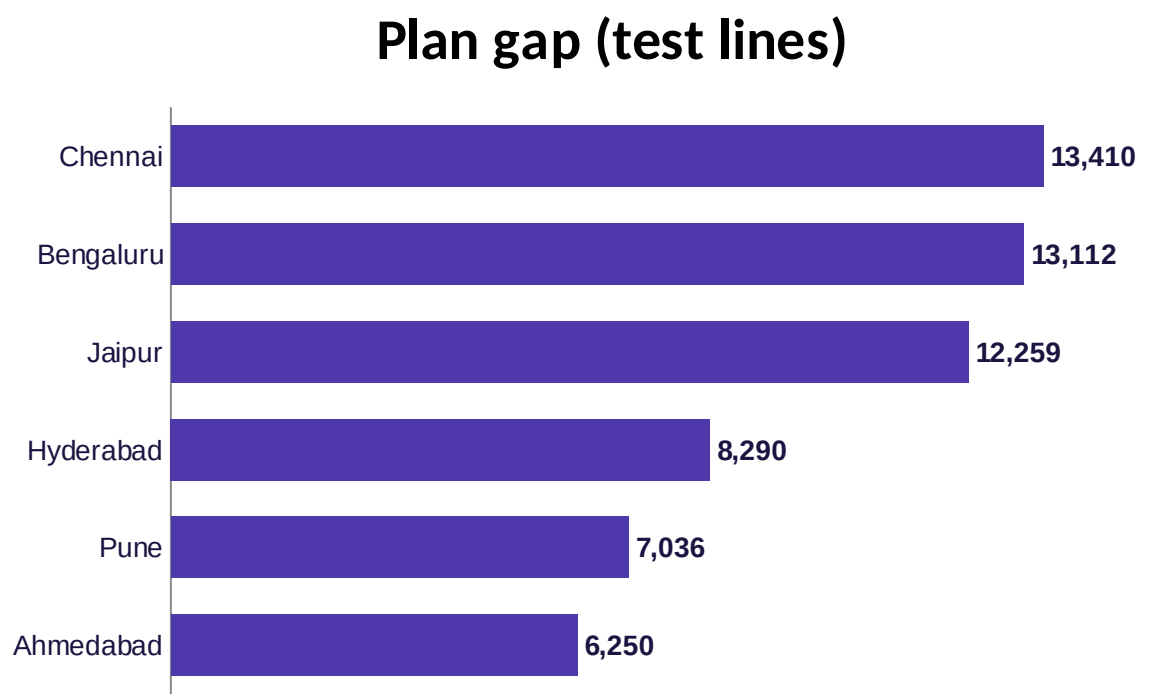

Denominator and period: sum of n_tests on validated bookings, superseded rescheduled records removed; full local H1 periods based on slot_at. These are booking test lines — not tests performed.

Versus plan: the H1 2026 plan implied +18.94% relative to H1 2025 actual; actual reached 88.30% of target — a candidate shortfall of 60,357 lines (-11.70%).

The numbers behind the claim, and the provisional plan gap by city

Number 1: 433,611 test lines, H1 2025 (same rule)
Number 2: 455,383 test lines, H1 2026 (same rule)
Number 3: +21,772 lines, +5.02% year on year
Number 4: plan implied +18.94%; actual = 88.30% of target, H1 2026
Number 5: candidate shortfall 60,357 lines (-11.70%)

Each number uses the same denominator: sum of n_tests on validated bookings, H1 periods based on slot_at.

Provisional plan gap by city (test lines, H1 2026). City key coverage: 30/36 city/month keys match using exact labels; a city-alias sensitivity gives 36/36, pending owner approval — not officially approved.

What would change the claim; the approach we did not use

The one thing that would change this claim:
The official KPI definition remains unconfirmed — and Notebook 06 labels its headline “collected or no-show,” but its code does not filter collection status.
The formal Bangalore/Bengaluru plan crosswalk remains unconfirmed; prior-result-link rates were not recalculated on this denominator.
These are booking test lines, not tests actually performed — and the driver decomposition is descriptive accounting, not proof of which intervention will recover the plan gap.
The approach we did not use:
The city-alias sensitivity (36/36 keys) as the official match — because it is pending owner approval and the alias match is not approved, it is shown only as a sensitivity, not as the basis of the city plan-gap chart.

Confirm the rule first; only then rerun and decide

Do: KPI owner and Data/BI confirm and sign off the test-volume unit, event date, denominator, validation rules and reschedule rules, plus the monthly dashboard-to-row bridge; Finance/city-reference owner confirms the Bangalore/Bengaluru crosswalk.
Hold: do not change city targets, staffing, or reagent plans before sign-off.
Owners: COO/KPI owner, Data/BI and Finance; city heads review the largest provisional plan gaps.
It costs: one analyst day plus a one-hour owner review.
Decision gate: rerun using the signed rule, then confirm any city action with city heads.
What we would do with two more days: reconcile the dashboard-to-row bridge and re-run the alias sensitivity on the signed rule, before any city conversation.
